Four methods for calculating the breaking strength of  
reinforced concrete members subjected to simple or  
compound bending have been compared with the test  
results published in the literature and comprising a  
total of 1553 usable tests. These tests relate to  
members having a rectangular, T, or inverted-T  
section, with a single or twin reinforcement made of  
mild steel or high-tension steel. The four methods of

It is shown that it is possible to obtain, by means of  
ion exchangers, the condensations between the linear  
aldehydes and the furfural, - the acetals starting  
from the furfural and the benzaldehyde. (Author)
